SWYNEX Technologies — Web Security Review Evidence

Task 3 / Task 4 Supporting Evidence

Environment: OWASP Juice Shop running locally at localhost:3000. Tool: Chrome Developer Tools. This document organizes the screenshots supplied for review.

Assessment notes

• The screenshots show the local Juice Shop application, product-search results, and browser Developer Tools.

• A successful HTTP 200 response or visible JSON product data is not, by itself, proof of a vulnerability.

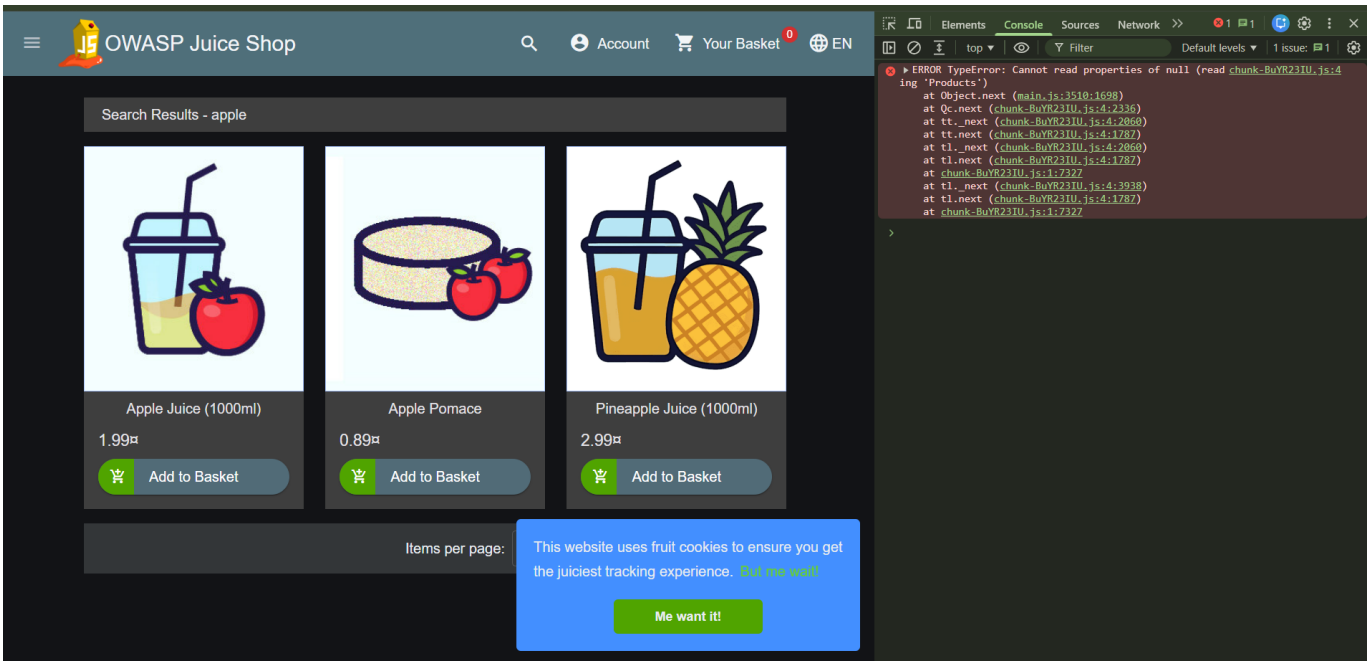

• The supplied Console screenshot contains a JavaScript TypeError. Its root cause and security impact have not been verified, so it is recorded as an observation rather than a confirmed vulnerability.

• In the inspected response, X-Content-Type-Options: nosniff and X-Frame-Options: SAMEORIGIN were observed. Content-Security-Policy and Strict-Transport-Security were not found in the inspected response; this does not establish their absence across the entire application.

• These screenshots do not independently prove an exploitable vulnerability. Findings should be updated only when supported by reproducible evidence.

Evidence 1 — Console observation

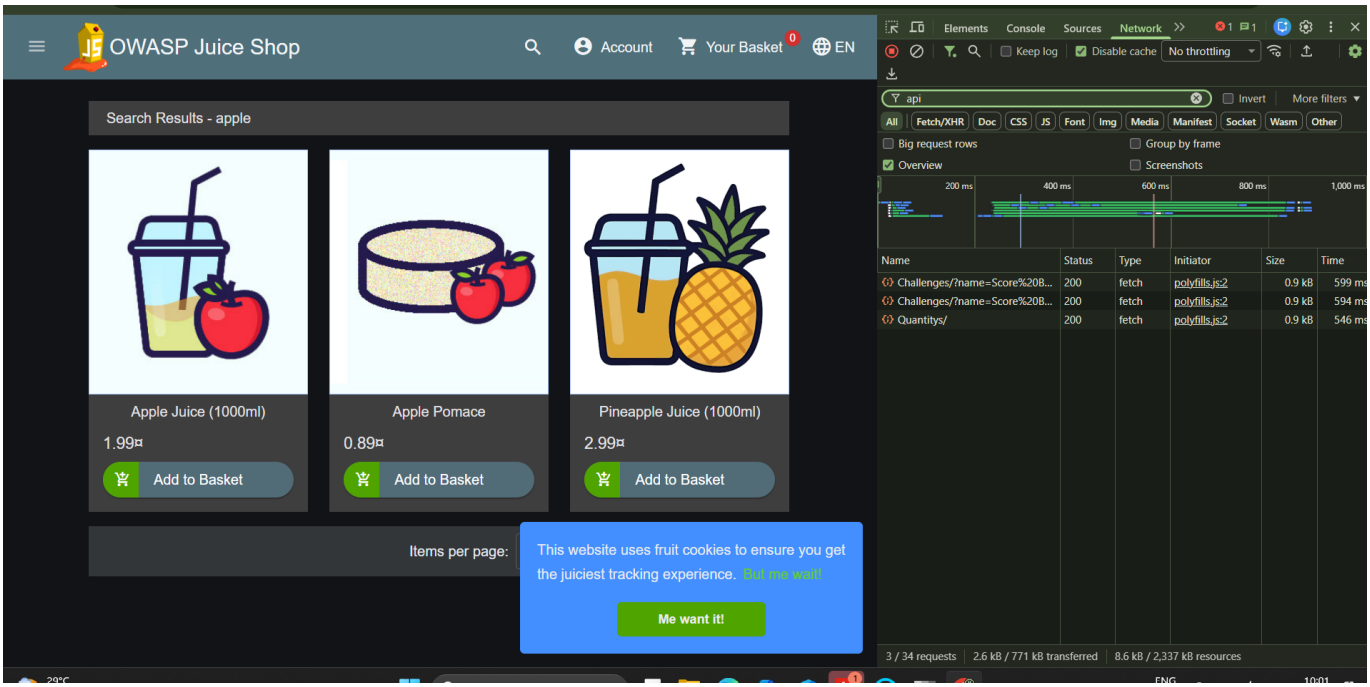

The browser Console displays a TypeError while product search results are visible. The error requires further investigation; no security impact is claimed.

Security reminder: before publishing screenshots, ensure no authentication tokens, cookies, personal data, or other secrets are visible.

Evidence 2 — Network request overview

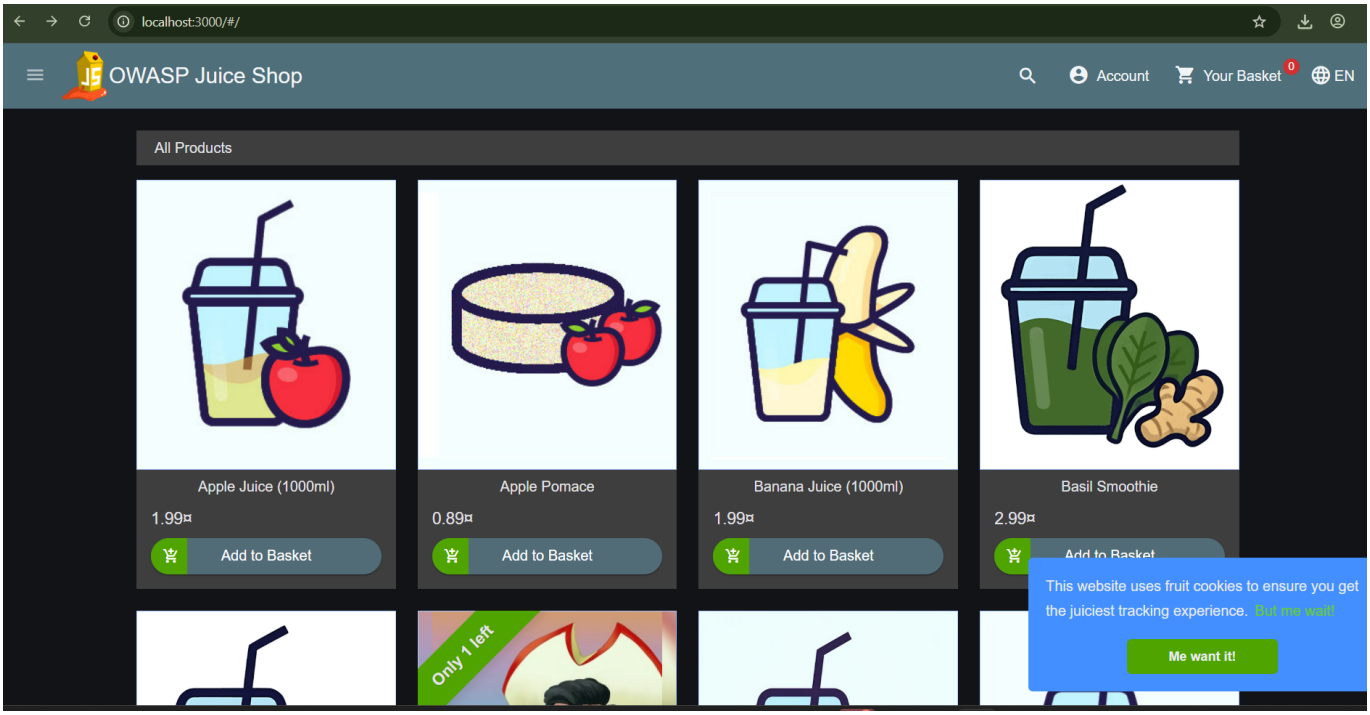

The Network panel shows Fetch/XHR requests and HTTP 200 statuses. This is an overview, not proof of a vulnerability.

Security reminder: before publishing screenshots, ensure no authentication tokens, cookies, personal data, or other secrets are visible.

Evidence 3 — Local application homepage

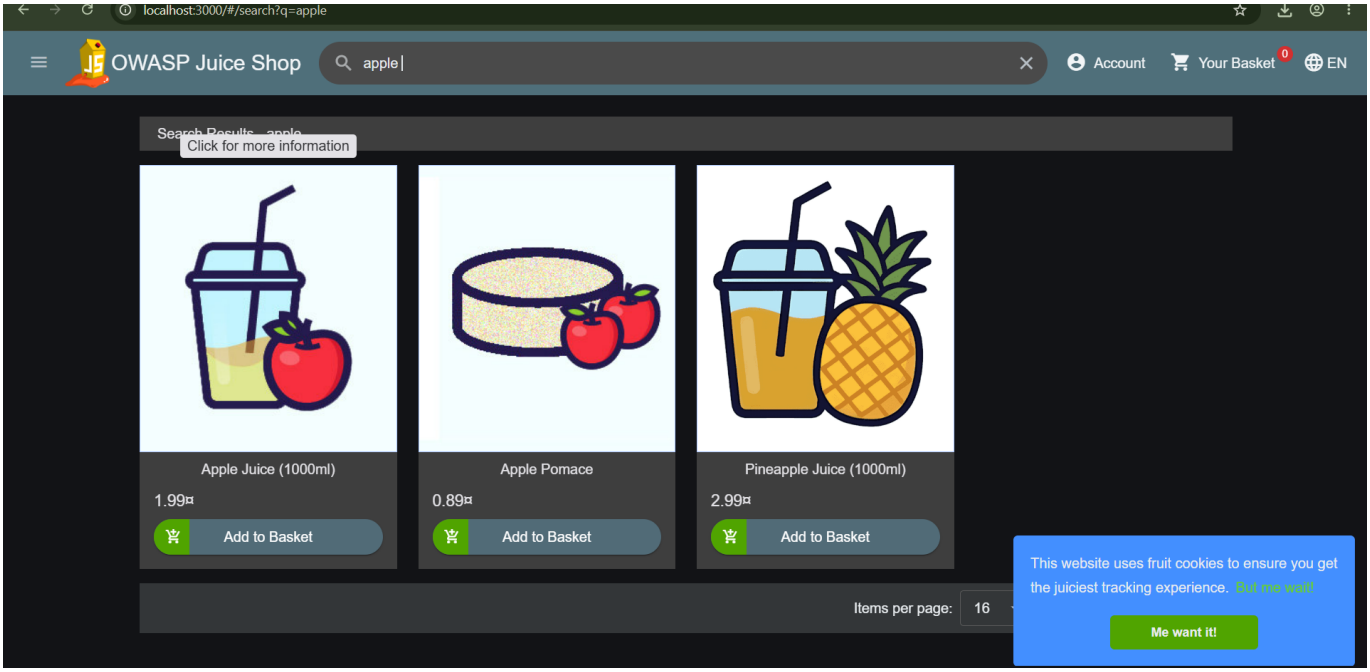

The OWASP Juice Shop local training application is open in the browser.

Security reminder: before publishing screenshots, ensure no authentication tokens, cookies, personal data, or other secrets are visible.

Evidence 4 — Product search results

The search page displays results for the query “apple”, demonstrating the search interface in use.

Security reminder: before publishing screenshots, ensure no authentication tokens, cookies, personal data, or other secrets are visible.
